

ELECTROCHIMIE ET CHIMITRONIQUE.

ELECTROCHEMISTRY AND CHEMITRONICS

Lecturers: Naoufel HADDOUR

| Lecturers : 12.0 | TC : 12.0 | PW : 8.0 | Autonomy : 12.0 | Study : 4 | Project : 0.0 | Language : FR

Objectives

Objectives of this course is to study the physicochemistry of electronic transfers at electrode/ electrolyte interfaces and concepts of electrochemical engineering. A large part of the course will be based on a concrete example of an industrial effluent treatment process. This course is mainly conducted in the form of problem-based learning, in group work, with individual evaluation at the end of the project.

Keywords : Butler-Volmer model, fuel cells, corrosion, electrolysis, battery

Programme

This course will be presented in the form of a case study to address the following concepts:

- 1) Electrochemical thermodynamics: Spontaneous and non-spontaneous redox reactions. Maximum and minimum voltages for galvanic and electrolytic systems.
- 2) Electrochemical kinetics: Butler-Volmer model with and without transport limitations. Tafel plot analysis. Linear and cyclic voltammetry.
- 3) Transport / Fluidic: Diffusion, migration, and convection of electroactive species in different systems.
- 4) Electrochemical reactors: Architecture, characterization and scaling.

Learning outcomes

- Differentiate between galvanic and electrolytic reactions.
- Determine electrochemical thermodynamic efficiency and voltage of a redox system.
- Determine key kinetic models used to characterize electrochemical devices.
- Design electrodes and operating conditions with favorable performance for specific applications.

Independent study
